

Lesson Guide - Introducing Buildah and Dockerfiles

While there are a great number of preconfigured container images available, sometimes you will have the need to create your own custom container images. Buildah is a part of the Podman landscape that allows you to do this. In this lesson, we will take a look at Buildah. We will also take a basic look at Dockerfiles, which we can use to define a container's configuration. Upon completion of this lesson, you will have a solid basic understanding of both Buildah and Dockerfiles.
